

Machine Learning

Regularization

The problem of overfitting

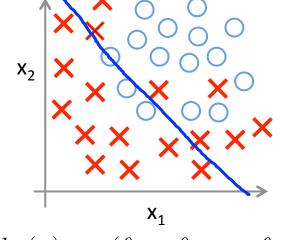

Example: Linear regression (housing prices)

Overfitting: If we have too many features, the learned hypothesis may fit the training set very well $J(\theta) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2 \approx 0$, but fail to generalize to new examples (predict prices on new examples)

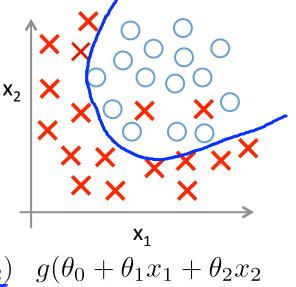

Andrew Ng

Example: Logistic regression

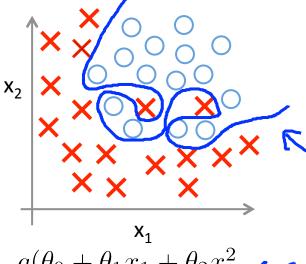

$$\mathbf{x}_1$$

$$\mathbf{h}_{\theta}(x) = g(\theta_0 + \theta_1 x_1 + \theta_2 x_2)$$
(g = sigmoid function)

$$g(\theta_{0} + \theta_{1}x_{1} + \theta_{2}x_{2} + \theta_{3}x_{1}^{2} + \theta_{4}x_{2}^{2} + \theta_{5}\overline{x_{1}}x_{2})$$

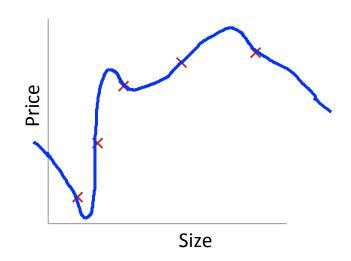

$$g(\theta_0 + \theta_1 x_1 + \theta_2 x_1^2 + \theta_3 x_1^2 x_2 + \theta_4 x_1^2 x_2^2 + \theta_5 x_1^2 x_2^3 + \theta_6 x_1^3 x_2 + \dots)$$

Addressing overfitting:

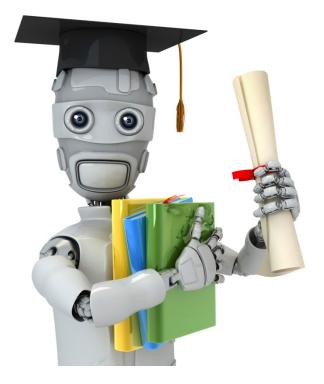

```
x_1 =  size of house x_2 =  no. of bedrooms
x_3 = \text{ no. of floors}
x_4 = age of house
x_5 =  average income in neighborhood
x_6 = \text{kitchen size}
```

Addressing overfitting:

Options:

- 1. Reduce number of features.
- → Manually select which features to keep.
- Model selection algorithm (later in course).
- 2. Regularization.
 - \rightarrow Keep all the features, but reduce magnitude/values of parameters θ_i .
 - Works well when we have a lot of features, each of which contributes a bit to predicting y.

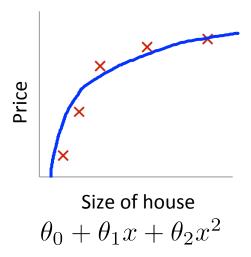

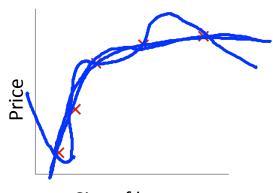

Regularization

Cost function

Machine Learning

Intuition

Size of house

$$\theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$$

Suppose we penalize and make θ_3 , θ_4 really small.

Regularization.

Small values for parameters $\theta_0, \theta_1, \ldots, \theta_n \in$

- "Simpler" hypothesis
- Less prone to overfitting

Housing:

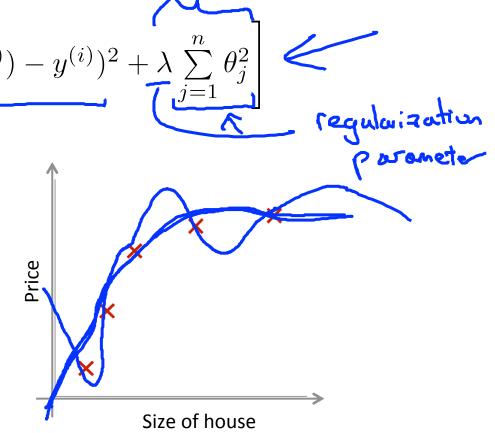

- Features: x_1, x_2, \dots, x_{100}
- Parameters: $\theta_0, \theta_1, \theta_2, \dots, \theta_{100}$

$$J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \lambda^2 \right]$$

Regularization.

$$J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y \right]$$

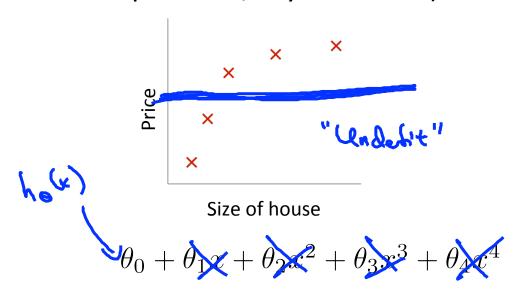

$$\min_{\theta} J(\theta)$$

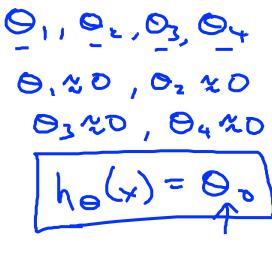

In regularized linear regression, we choose θ to minimize

$$J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \lambda \sum_{j=1}^{n} \theta_j^2 \right]$$

What if λ is set to an extremely large value (perhaps for too large for our problem, say $\lambda=10^{10}$)?

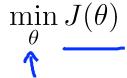

Machine Learning

Regularization

Regularized linear regression

Regularized linear regression

$$J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \left(\sum_{j=1}^{n} \theta_j^2 \right) \right]$$

Gradient descent

$$\theta_0 := \theta_0 - \alpha \frac{1}{m} \Big|_{i}$$

$$\alpha \frac{1}{m}$$

$$\sum_{i=1}^{1} (h_{\theta}(x^{(i)}) - y^{(i)}) x_0^{(i)}$$

$$\frac{1}{m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)}) x_{j}^{(i)} - \frac{\lambda}{m}$$

$$(j=X,1)$$

$$> \theta_j$$

$$(1-\alpha\frac{\lambda}{m})$$

Normal equation

$$X = \begin{bmatrix} (x^{(1)})^T \\ \vdots \\ (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \min_{\theta} J(\theta)$$

$$\Rightarrow 0 = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

$$\exists (x^{(m)})^T \end{bmatrix}$$

$$\Rightarrow \sum_{\theta} J(\theta) = (X^T \times + \lambda)$$

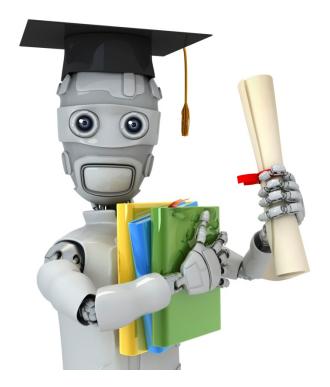

$$\exists (x^{(m)})^T \end{bmatrix}$$

Non-invertibility (optional/advanced).

Suppose
$$m \le n$$
, (#examples) (#features)

$$\theta = \underbrace{(X^T X)^{-1} X^T y}_{\text{Non-invertible / singular}}$$

If
$$\lambda > 0$$
,
$$\theta = \left(X^T X + \lambda \begin{bmatrix} 0 & 1 & 1 & 1 \\ & 1 & & \\ & & \ddots & 1 \end{bmatrix} \right)^{-1} X^T y$$

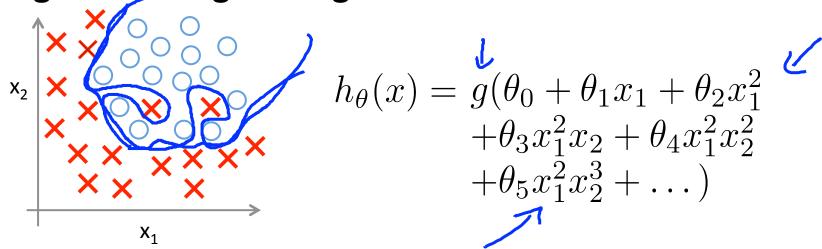

Machine Learning

Regularization

Regularized logistic regression

Regularized logistic regression.

Cost function:

$$J(\theta) = -\left[\frac{1}{m} \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)} + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)}))\right]$$

$$+ \frac{\lambda}{2m} = 0$$

Gradient descent

Repeat {

$$\theta_{0} := \theta_{0} - \alpha \frac{1}{m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)}) x_{0}^{(i)}$$

$$\theta_{j} := \theta_{j} - \alpha \left[\frac{1}{m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)}) x_{j}^{(i)} - \frac{\lambda}{m} \delta_{j} \right]$$

$$\{j = \mathbf{X}, 1, 2, 3, \dots, n\}$$

$$\{j = \mathbf{X}, 1, 2, 3, \dots, n\}$$

Advanced optimization
